# Market Structure Trading Plan

## Core Concept

This strategy is built around identifying the main 4H trend, finding internal structure, waiting for a Break of Structure (BOS), trading pullbacks into supply/demand zones, and using the 15M timeframe for execution.

## 4H Swing Structure

Use the 4H timeframe to determine overall market direction. Bullish structure forms with higher highs and higher lows. Bearish structure forms with lower lows and lower highs. A valid BOS requires candle closes beyond structure, not just wicks.

## Strong & Weak Swing Points

After a bullish BOS, identify the furthest down candle before the impulse move as the Strong Swing Low. The high formed during retracement becomes the Weak Swing High and acts as the target. Reverse this logic for bearish structure.

## Supply & Demand Zones

Mark supply/demand zones inside the impulse range between the BOS and the strong swing point. Wait for price to retrace into these areas before looking for continuation trades.

## Internal Structure

Analyze internal structure on both the 4H and 15M timeframes using the same BOS and strong/weak high-low concepts. Internal structure should support the higher timeframe swing.

## 15 Minute Analysis

Use the 15M timeframe as the execution timeframe. Mark BOS, strong/weak highs and lows, and supply/demand zones. If the 15M aligns with the 4H swing direction, target the 4H weak highs/lows.

## Main Trading Sequence

Break of Structure → Pullback → Continuation.

## Playbook A — Trend Continuation

4H swing and 15M internal structure are aligned. Wait for price to retrace into the 4H supply/demand zone, then wait for 15M confirmation BOS before entering. Target the 4H weak highs/lows and place stop loss below/above the 15M strong swing point.

## Playbook B — Aggressive Continuation

Enter directly from the 4H supply/demand zone without 15M confirmation. Higher risk and generally not recommended unless experienced.

## Playbook C — Pullback Trade

Trade the retracement against the 4H swing direction. Example: 4H bullish while 15M turns bearish internally. Target the 4H demand zone with stop loss beyond the 15M strong swing high/low.

## Playbook D — Immediate Zone Entry

Same concept as Playbook A but without waiting for 15M confirmation. Enter immediately upon touching the 4H supply/demand zone.

## Full Workflow

1. Analyze 4H swing structure. 2. Mark BOS, strong/weak highs and lows, supply/demand. 3. Analyze 4H internal structure. 4. Drop to 15M. 5. Determine alignment. 6. Execute using BOS → Pullback → Continuation.

## Key Principles

Strong highs/lows are protected structure points. Weak highs/lows are liquidity targets. 4H provides directional bias while the 15M handles execution and risk management.
